//note="Vector: pAMP10; cDNA, was generated from cytoplasmic RNA using a mixture of random DNA hexamers and oligo(dT).
From this pool of cDNA, human chromosome 7-enriched cDNA was isolated by direct cDNA, selection using chromosome 7 genomic DNA (cosmids). The resulting direct selected cDNA was cloned into a plasmid vector using a non-directional uracil DNA glycosylase (UDG)-mediated cloning strategy."

Weber JL; WPI; 97-042299/04. WPI; 97-042299/04. PI Detection of polymorphic genetic markers of the form Detection of polymorphic nucleic acid mols. as primers (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers primers placed primers (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commaning the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated by hybridisation for purbe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by pinners T65798-T66047. Those clones where the repeat sequence has been determined are shown in T65704-797. This repeat sequence is from the marker clone Mdf33 which contains the repeat Sequence 56 BP; 28 A; 27 C; 0 G; 1 T;	<pre>marker clone Mfd33. enetic marker; primer; paternity; maternity; ! e; animal; plant; bree</pre>	NNENTS

PI (dC-dA)n(dG-dT)n - using novel nucleic acid mois. as primers of cd-dA)n(dG-dT)n - using novel nucleic acid mois. as primers primers listic primers to the isolation of polymorphic repeat sequences of the invention relates to the isolation of polymorphic repeat sequences comparing the sequence (GC-dA)n, (GG-dT)n which can be used to detect these crepeats, especially for use in e.g paternity or maternity testing, commarkers. Primers based on these sequences can be used to detect these crepeats, especially for use in e.g paternity or maternity testing, commarkers. Primers based on these sequences analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of cromosome-specific phage libraries with a synthetic poly(CC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers T65798-T66047. Those clones where the repeat sequence has been determined are shown in T65704-797. This repeat compared to the marker clone wdf12 which contains the repeat compared to the communia. (AC)11AT(AC)8A.

Programming, and selective breeding

Table 7; Page 371; 517pp; English.

CC The sequence is that of a bovine microsatellite sequence obtd.

CC by screening a library of bovine MooI DNA fragments of between

CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.

CC One out of 50 clones cross-hybridised. Assuming independent

CC (15)n >9 microsatellites in the bovine genome is estimated at >100,

CC (16)n >9 microsatellites in the bovine genome is estimated at >100,

CC (16)n >9 microsatellites in the bovine microsatellites

CC (16)n >9 microsatellites in the bovine microsatellites

CC (16)n >9 microsatellites in the bovine microsatellites

CC (16)n >9 microsatellites in the specification and indexed herein (see below).

CC (17)n >9 microsatellites may be used to introcatellite sequence

CC were used to generate the required PCR primers for in vitro

CC amplification of the corresp. microsatellite (using the program

CC (16)n parentage testing, and in the genetic mapping of economic trait

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PT gene mapping, and selective breeding
PT Table 7; Page 331; 517pp; English.
CC The sequence is that of a bovine microsatellite sequence obtd. by
CC Screening a library of bovine MboI DNA fragments of between
CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
CC One out of 50 clones cross-hybridised. Assuming independent
CC distribution of microsatellites and MboI sites, the frequency of
CC (T6)n >9 microsatellites in the bovine genome is estimated at >100,
CC 000. The sequence information for ca. 230 such bovine microsatellites
CC is summarised in the specification and indexed herein (see below).
CC The sequences upstream and downstream of the microsatellite sequence
CC were used to generate the required PCR primers for in vitro
CC amplification of the corresp. microsatellite (using the program
CC OPTIFRIM). The microsatellites may be used to identify individuals,
CC for parentage testing, and in the genetic mapping of economic trait
CC traits esp. in cattle, to allow selective breeding.
CC See also Q33501-34437.

PDE tection of polymorphic genetic markers of the form procedure of polymorphic genetic acid mols. as primers (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers from the invention relates to the isolation of polymorphic repeat sequences. The invention relates to the isolation of polymorphic repeat sequences (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g. paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) grobe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers T65798-T66047. Those clones where the repeat sequence has been determined are shown in T65704-797. This repeat sequence is from the marker clone Mdf34 which contains the repeat sequence having the formula: (AC)4AT(AC)15.

PT Polymorphic bovine DNA markers - used in genetic identification, price mapping, and selective breeding gene mapping, and selective breeding rable 7; Page 213; 517pp; English.

CThe sequence 1s that of a bovine microsatellite sequence obtd. by cc screening a library of bovine Mbol DNA fragments of between common to the sequence in the sequence Mbol DNA fragments of between common to follow by the analysish.

CC one out of 50 clones cross-hybridised. Assuming independent clistribution of microsatellites and Mbol sites, the frequency of common to follow by the sequence information for ca. 230 such bovine microsatellites common is estimated at >100, common to the sequence information and indexed berein (see below).

CC one sequences upstream and downstream of the microsatellite sequence complification of the corresp. microsatellite (using the program complification of the corresp. microsatellite (using the program complification of the corresp. microsatellite (using the program complification that the sequence in the genetic mapping of economic trait compliments for in vitro and in the genetic mapping of economic trait compliments of the control trait compliments of the control trait to compliment compliments for in vitrol compliments.

The amplified fragments are then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method can be used to detect genetic variation. See Q27389-Q27404 and Q33141-Q33144. PS Disclosure; Column 9-10; 186pp; English.

CC having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic CC markers. Primers based on these sequences can be used to detect these CC repeats, especially for use in e.g paternity or maternity testing, CC human genetic annlysts such as linkage analysis of genetic disease, CC commercial animal or plant breeding or pedigree analysis. Clones CC containing the repeat sequences were isolated by hybridisation of CC chromosome-specific phage libraries with a synthetic poly(GC-dA).(dG-dT) CC probe. Over 100 repeat blocks were isolated. The inserts from the clones CC were amplified by primers T6598-T66047. Those clones where the repeat sequence has been determined are shown in T65704-797. This repeat CC sequence is from the marker clone Mdf36 which contains the repeat CC sequence having the formula: (AC)15A7 (AC)16A.

SQ Sequence 45 BP; 23 A; 21 C; 0 G; 1 T;
prigne mapping, and selective breeding
Prable 7; Page 277; 517pp; English.

CC The sequence is that of a bovine microsatellite sequence obtd. by
CC screening a library of bovine mbol DNA fragments of between
CC 50 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
CC 0ne out of 50 clones cross-hybridised. Assuming independent
CC (T6)n >9 microsatellites in the bovine genome is estimated at >100,
CC (00). The sequence information for ca. 230 such bovine microsatellites
CC is summarised in the specification and indexed herein (see below).
CC the sequences upstream and downstream of the microsatellite sequence
CC were used to generate the required PCR primers for in vitro
C amplification of the corresp. microsatellite (using the program
CC optiprim). The microsatellites may be used to identify individuals,
CC loci, or genes involved the determinism of economically important
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

PT PROPAGATION USING Vector comprising yeast centromere, marker, pr recombination using vector comprising yeast tentromere, marker, pr yeast telomere and nucleic acid for recombination

PT Yeast telomere and nucleic acid for recombination

CC This is the nucleotide sequence for the PCR primer used in the Example 1; Page 45; 117pp; English.

CC This is the nucleotide sequence, which is used to amplification of the Alu repeat sequence, which is used to comprise the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of the selectively clone specific nucleic acids from a background of the creation be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

CT The sequence is that of a bovine microsatellite sequence obtd. by

CC Screening a library of bovine MboI DNA fragments of between

CC One out of 500 bp with an (AC)15 and a (TC)15 oligonuclectide probe.

CC One out of 50 clones cross-hybridised. Assuming independent

CC One out of 50 clones cross-hybridised. Assuming independent

CC (T6)n >9 microsatellites in the bovine genome is estimated at >100,

CC (T6)n >9 microsatellites in the bovine genome is estimated at >100,

CC out of sequence information for ca. 230 such bovine microsatellites

CC summarised in the specification and indexed herein (see below).

CC were used to generate the required PCR primers for in vitro

amplification of the corresp. microsatellite (using the program

CC optiprim). The microsatellites may be used to identify individuals,

CC for parentage testing, and in the genetic mapping of economic trait

CC loci, or genes involved the determinism of economically important

CC see also Q33501-34437.

Primer PDJ33 is one of several primers which are preferred for use in amplifying inter-Alu regions of DNA. The amplified fragments are then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method can
                                                                                                                                                                                                                                                                             be used to detect genetic variation.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine Mbol DNA fragments of between 250 and 500 bp with an (Ac)15 and a (Tc)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and Mbol sites, the frequency of (76)n >9 microsatellites in the bovine genome is estimated at >100, DNA fragments of the sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence amplification of the corresp. microsatellite (using the program of DTIPRIM). The microsatellites may be used to identify individuals, cf or parentage testing, and in the genetic mapping of economic trait cross-testing, and in the genetic mapping of economic trait craits esp. in cattle, to allow selective breeding.

Example 2; Page 42; B2pp; English. Competition experiments using the DNAseI protection assay showed that an oligonucleotide contg. 15 tandem ATT repeats was an effective competitor for binding of the HeLa factor. This oligo was used to prepare an oligonucleotide affinity column for purification of RIP60 from Chinese hamster cells. The protein recognises and binds to an (ATT)n motif in the diff gene ori. It can also bind to the yeast ARSI domain B. See Q22753 and Q24811.

PT New biocompatible medical devices and articles - using a lactic process.

PT scid-glycolic acid polyester in which monomer units are processed and specifically determined sequence represents the 5' fragment of the synthetic genes which cannot polyesters given in 071801-02. This fragment was ligated into cende polyesters given in 071801-02. This fragment was ligated into cand 5' ends of the plasmid psporT in digested with FokI. This places cand 5' ends of the plasmid psporT in digested with FokI. This places cand 5' ends of the plasmid psporT in digested with FokI. This places can 5' ends of the plasmid psporT in digested with FokI. This places can 5' ends of the plasmid psporT in digested with FokI. This places can in 071801-02 in an E. coli cell free medium. The expressed can sequences represent synthetic genes which were used in the synthesis complete the coli trap initiator.

CC of polyesters derived from the amaino acid analogues of an amino acid except pro. of the three stop codons, UAA, UAG and UGA, one of these coli call trap and UAA, one of these coli call trap and UAA, one of these cannot can be polyester. Lactate and glycolate are encoded by UAA and CC UAG, respectively. Initiation of translation may be encoded by an accomplished through the use of a specially modified to carry lactate instead of Met alternatively, a Met is incorporated in the first position of the polymer chain. The cc resulting polymer is treated with cyanogen bromide to remove the Met. CC opolymers produced in this manner may be used to produce sutures, so sequence 80 Bp; 47 A; 6 C; 4 G; 23 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PT New biocompatible medical devices and articles - using a lactic pri acid-glycolic acid polyester in which monomer units are pri individually and specifically determined pri individually and specifically determined pri individually and specifically determined price of the sequences given in Q71814-16 represent fragments of the casynthetic polyester genes given in Q71801-02. These fragments were cused in the production of the full length polyester gene in the plasmid cused in the production of the full length polyester could be expressed in an E. coli cell free medium, as pMAL-p2 is recognised by E. coli cribozymes and contains the necessary initiator sequences and the cused in the polyester coding sequence ligated in frame with ct the leader sequence. The expressed sequences represent synthetic genes which were used in the synthesis of polyesters derived from the codons, UAA, UAG and UGA, one of these stop codons is reversed for the codons, UAA, UAG and UGA, one of these stop codons is reversed for the codons jupical for the polyester. The remaining two stop codons are coding signal for the polyester. The remaining two stop codons are coded by UAA and UAG, respectively. Initiation of the chain may be encoded by UAA and UAG, respectively. Initiation of through the use of a specially modified met-tRNAf modified to carry clarcate instead of Met. Alternatively, a Met is incorporated in the customer may be used to remove the Met. Co-polymers produced in this calculation and code in the polymer chain. The resulting polymer is treated controlled to remove the Met. Co-polymers produced in this calculation and code in the second code in the second code in the second code in this and sorrews.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-JUL-1994.

gene mapping, and selective breeding
Table 7; Page 178; 517p; English.
The sequence is that of a bovine microsatellite sequence obtd. by
screening a library of bovine MboI DNA fragments of between
250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
One out of 50 clones cross hybridised. Assuming independent
distribution of microsatellites and MboI sites, the frequency of
(T6)n >9 microsatellites in the bovine genome is estimated at >100,
000. The sequence information for ca. 230 such bovine microsatellites
is summarised in the specification and indexed herein (see below).
The sequences upstream and downstream of the microsatellite sequence
                                                                                                                                                                                                                                                                                                                                                                 Georges M, Massey JM;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 4; Figure 3A; 13pp; English.
Claim 4; Figure 3A; 13pp; English.
The inventors claim an asymmetrically tailed plasmid primer comprising a cut,ds DNA plasmid contg. a functional origin of replication and at least one functional selection marker gene, one 3 terminus of which contains an oligo (dT) extension, the other 3' terminus of which contains an oligo (dC) or oligo (dG) extension terminus of which contains an oligo (dC) or oligo (dG) extension terminated by a 3' phosphate group. More specifically, the asymmetrically tailed plasmid primer is produced by SacI and KpnI cleavage of plasmid plp, and each terminus produced by the cleavage is joined to the complementary adaptor, which is Q52731 or Q52732.

Claim 5; Figure 3B; 13pp; English.
The inventors claim an asymmetrically tailed plasmid primer comprising a cut, ds DNA plasmid contg. a functional origin of replication and at least one functional selection marker gene,
                                                                                                                        wPI; 93-404926/50.
Asymmetrically tailed plasmid primers - comprises cut, double-stranded DNA plasmid, useful for producing cloning
                                                                                                                                                                                         Margolskee

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chondrocytes and inhibits vascular endothelial cell growth care for the chondrocytes and inhibits vascular endothelial cell growth example 4; Page 10; 34pp; English.

Q78635 and Q78636 are a pair of primers for Q78627-Q78632 which encode R65486-R65491 respectively, human chondromodulin-1 (CM-1), a chondrocyte growth regulator. CM-1 as part of a pharmaceutical compsn. with a carrier, excipient or solvent, can be used to stimulate chondrocyte growth. CM-1 also inhibits vascular endothelial cell growth, by promoting the differential potency of chondrocytes.

More specifically, the plasmid primer is produced by EcoRI and HindIII cleavage of plasmid pUC19, and each terminus produced by the cleavage is joined to the complementary adaptor, which is Q52733 or Q52734. CC Drain cone As301_2. The clone was isolated from a human fetal portion of clone As301_2. The clone was isolated from a human fetal cone conding a secreted protein. V05739 provides 5; portion of the nucleotide concoding a secreted protein. V05739 provides 5; portion of the nucleotide concoding a secreted protein. V05739 provides 5; portion of the nucleotide concoding a secreted protein. V05739 provides 5; portion of the nucleotide concoding a secreted protein. V05739 provides 5; portion of the nucleotide concoding a secreted protein. V05739 provides 5; portion of the nucleotide concoding a secreted protein of genetic disorders and sources control concoding and primers. They can also be used to generate anti-protein concoding and protein is useful for raising antibodies, as immunoassay reagents and as nutritional supplements. The protein may possibly have any of a protein and protein anti-protein and protein and protein and possibly have any of a protein and prot

                                            Example 7; Page 21-26; O/PP) variable. Example from the present sequence represents a probe used in an example from the present invention. The present invention describes an analytical solid phase method for detecting nucleic acids. The method comprises obtaining a base sequence which hybridises with the polynucleotide sequence of the target, and a set of probes immobilised on the solid phase via a linker which is enzymatically ligated during hybridisation. The product is used for the detection of specific nucleic acids. Possible fields of application include diagnosis of disease, detection of drug sensitivity, screening for appropriate transplantation organs, testing in the food industry to prevent food poisoning. A simple, quick method for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bowman M, E

Preparation of yeast artificial chromosomes - by in vivo recombination using vector comprising yeast centromere, marker, yeast telomere and nucleic acid for recombination Example 1; Page 45; 117pp; English.
This is the nucleotide sequence for the PCR primer used in the amplification of the Alu repeat sequence, which is used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                V19045;
28-JUL-1998 (first entry)

                                                                                                                                                      demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

Result

51

greater than

greater than or equal to the score of the result being derived by analysis of the total score distribution

is the number of results predicted by chance to have a ater than or equal to the score of the result being printed,
